

Mela Meeting Assistant

User Guide, Privacy, Security & Compliance Overview

Microsoft 365 meeting intelligence with enterprise governance in mind

Document type	Customer-facing product and security guide
Edition	Consolidated edition - September 2026
Document owner	Armely LLC
Audience	Users, Microsoft 365 admins, security, privacy, procurement and compliance teams

This guide complements the Mela Terms of Use and Mela Privacy Policy. Where a signed agreement conflicts with this guide, the signed agreement controls.

Document Control

Item	Details
Document purpose	Provide a clear end-to-end description of Mela Meeting Assistant, including user workflows, Microsoft 365 administration, privacy, security controls, the confirmed Azure processing model, and the current SOC 2 readiness and attestation program status.
Scope	Mela Meeting Assistant and its supported Microsoft Teams, Microsoft Planner, Outlook, calendar, and related Microsoft 365 integrations.
Legal status	Informational. This guide does not replace the Mela Terms of Use, Privacy Policy, Data Processing Agreement, order form, or other signed customer agreement.
Security assurance	Armely is actively progressing through its SOC 2 readiness and attestation program and has begun the formal process toward independent SOC 2 examination. Until an applicable SOC 2 report is issued, Armely does not represent Mela as SOC 2 attested.
Last reviewed	September 14, 2026

Major sections are shown above. Subsections follow the numbering within each section.

1. Executive Overview

Mela Meeting Assistant is an enterprise productivity assistant designed to turn Microsoft Teams conversations into structured outcomes. It can capture live meeting transcripts, identify decisions and action items, generate summaries and minutes, answer questions about meeting content, create Microsoft Planner tasks after user review, and deliver approved follow-up content through Outlook.

The product is designed around customer control. Mela joins a meeting when invoked, provides participant-facing notice in the Teams experience, supports pause, resume, and leave commands, and requires Microsoft 365 administrative onboarding before protected organizational content can be retrieved.

Security and privacy posture at a glance

Mela is designed to use Microsoft 365 identity and administration controls, logical tenant scoping, role-based authorization, encryption in transit and at rest, controlled integration permissions, monitoring, and operational security practices. Customers remain responsible for their own Microsoft 365 tenant configuration, user lifecycle, endpoint security, and any legally required meeting notice or consent.

Area	Mela approach
Meeting control	On-demand join, pause, resume, and leave commands.
Identity	Microsoft Entra ID and tenant-aware authorization for protected organizational content.
Data protection	Encrypted transmission and storage for protected content, logical organization-level scoping, no retained meeting audio/video, and a standard 30-day transcript retention period.
Outputs	Summaries, minutes, transcripts, decisions, action items, email follow-ups, and Planner tasks.
Privacy	Customer controls use of Mela and remains responsible for required participant notices and consents.
AI use	Customer meeting content is not used to train unrelated general-purpose models unless expressly agreed in writing.
Assurance	Armely is actively progressing through its SOC 2 readiness and attestation program and preparing controls and evidence for independent examination.

2. Product Overview

2.1 What Mela can do

- Transcribe Microsoft Teams meetings in real time when invited and authorized.
- Answer live questions such as what was just said or what a named participant said about a topic.
- Generate concise summaries, formal minutes, key takeaways, and full transcripts.
- Produce a private one-page executive summary delivered to the requesting user rather than posted back to the meeting chat.
- Extract commitments, decisions, owners, risks, next steps, and action items.
- Allow users to review generated tasks before publishing them to Microsoft Planner.
- Draft, review, reply to, and send Outlook email when the authorized user requests those actions.
- Read authorized calendar information and support meeting preparation.
- Provide a searchable meeting history for authorized users, subject to tenant access controls, the standard 30-day transcript retention period, and applicable retention rules for derived outputs.

2.2 Intended users

User group	Typical use
Leadership	Capture decisions, risks, owners, and executive follow-up.
Sales	Track customer commitments, next steps, and follow-up actions.
Engineering	Convert technical discussions into owned tasks and referenceable meeting history.
Operations	Maintain consistent meeting knowledge and recurring action tracking.
Microsoft 365 administrators	Approve permissions, configure access, and manage tenant readiness.
Security and privacy teams	Review data handling, identity, access, retention, incident, and assurance controls.

2.3 Important use limitations

Mela-generated content may be incomplete, inaccurate, or contextually wrong. Users should review summaries, decisions, due dates, assignments, and other generated outputs before relying on them or publishing them into business systems.

Mela is not a substitute for legal, medical, financial, safety, human-resources, or other professional judgment. Organizations should not use Mela to process highly sensitive information unless that use is expressly supported by the applicable agreement, configuration, and organizational policy.

3. How Mela Meeting Assistant Works

3.1 Four-stage operating model

Stage	What happens	User control
1. Start	A participant adds Mela to the meeting and invokes it from Teams chat.	Mela does not need to remain present when not required.
2. Capture	Meeting content is processed to create a live transcript and meeting intelligence.	Users can pause, resume, or ask Mela to leave.
3. Review	Users request summaries, minutes, transcripts, takeaways, or executive recap content.	Generated output should be reviewed before reliance or distribution.
4. Execute	Approved actions can be sent by email or published into Microsoft Planner.	Users control when external actions are taken.

3.2 Data flow at a glance

Step	Flow
1	User invokes Mela in an authorized Microsoft Teams context.
2	Microsoft 365 identity, tenant, and application policies determine whether the request is permitted.
3	Meeting audio is processed in real time by Azure AI Speech to convert authorized meeting speech into transcript text. Mela does not retain meeting audio or video as stored customer media.
4	Azure OpenAI Service processes authorized transcript content to generate requested summaries, minutes, decisions, risks, action items, due dates, and related meeting intelligence.
5	Authorized transcripts may be stored in tenant-scoped service storage for later retrieval. The standard Mela transcript retention period is 30 days.
6	At the user's direction, approved content may be sent to connected Microsoft 365 services such as Planner or Outlook.
7	Operational and security events may be logged for reliability, support, monitoring, and incident investigation.

Audio and video handling

Mela does not retain meeting audio or video as stored customer media. Meeting audio is processed in real time through Azure AI Speech only as needed to generate transcript text. The resulting transcript is the primary meeting record used by Mela for downstream meeting intelligence.

4. Command & Feature Reference

In a Teams channel, mention the bot first because channel delivery depends on the bot mention. In direct or supported group chat contexts, the exact wording may vary because Mela is designed to understand natural language.

4.1 Live meeting controls

Command	Purpose
@mela please join	Join the current meeting and begin taking notes / transcription.
@mela pause recording	Pause note-taking for a sensitive or private portion of the meeting.
@mela unpause recording	Resume note-taking after a pause.
@mela please leave	Stop meeting capture and leave the meeting.

4.2 Live questions

Command	Purpose
@mela what did last person say	Return the most recent captured statement or a topic-specific variation.
@mela what did [name] say about [topic]	Return relevant captured content attributed to a named speaker and topic.

4.3 After the meeting

Command	Purpose
summarize	Create a concise recap.
generate minutes	Create formal minutes with decisions and action items.
fetch transcript	Retrieve the meeting transcript when the requester is authorized.
meeting overview	Return an overview of a past meeting available to the requester.
key takeaways	Return the highlights and main points.
send me the executive summary	Email a one-page executive recap to the requester.
send the last summary to my email	Email the most recently generated summary, minutes, or transcript.

4.4 Email, calendar, and help

Command	Purpose
check my inbox	Review recent or urgent messages available under the user's authorized Outlook context.
reply to [name]	Draft a reply to an email or thread.
draft an email	Draft a new email or invitation.
what meetings do I have today	View authorized calendar schedule or availability.
help me prepare for my meeting	Prepare a briefing for an upcoming authorized meeting.
my profile	Display the requester's own profile details.
help / @mela help	Display supported commands and guidance.

5. Example End-to-End Meeting Workflow

1. A project team starts a Microsoft Teams meeting.
2. A participant invokes Mela. Mela provides notice in the Teams meeting experience and begins meeting transcription / note-taking.
3. During the meeting, participants can ask live questions about captured content.
4. For sensitive discussion, an authorized participant can pause Mela and resume it later.
5. At the end of the meeting, the user asks for minutes or a summary.
6. The user reviews generated decisions, action items, owners, and due dates.
7. Approved tasks are published to Microsoft Planner.
8. Approved meeting recap content may be sent through Outlook.
9. Authorized users can retrieve stored meeting content later, subject to authorization and the standard 30-day transcript retention period.

Participant notice and consent

Mela's visible presence and meeting notice support transparency, but they do not replace legal or organizational consent requirements. The customer is responsible for determining and satisfying the notice, consent, recording, transcription, employment, communications, and workplace privacy requirements that apply to its meetings and jurisdictions.

6. Microsoft 365 Integration & Administration

6.1 Enterprise onboarding

1. Add Mela as an approved Microsoft Teams application through the organization's supported deployment process.
2. Grant the required Microsoft Entra ID application permissions through administrator consent.
3. Configure Teams application access / meeting policies for the pilot group, named users, or permitted organization scope.
4. Complete tenant activation so the organization is recognized as an authorized Mela tenant.
5. Validate access with designated test users before wider rollout.

6.2 Microsoft 365 permission principles

- Permissions should be limited to the functionality the customer enables.
- Administrator consent should be reviewed before deployment and after material permission changes.
- User actions involving mail, calendar, files, or connected services remain subject to Microsoft 365 authorization and tenant policy.
- Customers should use Conditional Access, MFA, account lifecycle, and device controls appropriate to their Microsoft 365 environment.
- Customers should periodically review enterprise applications, service principals, consent grants, and assigned access.

6.3 Shared responsibility model

Control area	Armely / Mela responsibility	Customer responsibility
Service security	Operate and secure Mela service components, integrations, monitoring, and service-side access controls.	Secure Microsoft 365 tenant, endpoints, networks, and customer-managed configurations.
Identity and access	Enforce service-side tenant and role authorization for protected Mela content.	Manage identities, MFA, Conditional Access, privileged roles, and user joiner/mover/leaver processes.
Meeting privacy	Provide on-demand controls and product notices within the supported Teams experience.	Determine lawful basis, required notices, consents, policies, training, and acceptable meeting use.
Data retention	Apply the Mela service retention and deletion controls, including the standard 30-day transcript retention period and non-retention of meeting audio/video.	Define internal retention requirements and document any contractual requirements that differ from the standard service baseline.
Microsoft services	Secure supported integrations and request only required permissions.	Maintain Microsoft licenses, tenant policies, Microsoft data governance, and connected service configuration.
Outputs	Generate meeting intelligence and allow review before supported downstream actions.	Review AI output before reliance, distribution, task publication, or business decisions.

7. Privacy & Data Protection

Privacy is handled as part of the service design and the customer relationship. Mela processes organizational data to provide the requested meeting, productivity, security, support, and service functions. The applicable Privacy Policy, Terms of Use, Data Processing Agreement, and signed customer documents govern the legal details of that processing.

7.1 Data categories Mela may process

Category	Examples	Why it is processed
Identity and tenant data	Name, business email, Microsoft Entra identifiers, tenant identifiers, roles, user / admin status.	Authenticate users, scope tenant access, administer the service, and support security.
Meeting metadata	Meeting title, time, organizer, participants, meeting identifiers.	Identify the meeting and connect outputs to the correct meeting context.
Meeting content	Live meeting audio processed in real time for transcription, transcript text, speaker attribution, and authorized user prompts and questions. Meeting audio and video are not retained by Mela as stored customer media.	Azure AI Speech converts authorized meeting speech into text. Transcript content is then used for Q&A and meeting intelligence, including summaries, minutes, decisions, and action extraction.
Derived content	Summaries, minutes, takeaways, executive recaps, decisions, risks, action items, task suggestions.	Deliver meeting intelligence and follow-up.
Connected Microsoft 365 data	Authorized Outlook email / calendar context and Planner task information when a user requests those functions.	Perform requested Microsoft 365 workflows.
Operational and security data	Usage events, application logs, timestamps, errors, security events, diagnostic information.	Operate, secure, troubleshoot, monitor, and improve service reliability.
Support information	Support messages, organization details, screenshots or diagnostics voluntarily provided to support.	Investigate and resolve customer issues.

7.2 Privacy roles

For organizational meeting content, the customer generally determines why and how Mela is used and Armely processes that content on the customer's behalf, subject to the applicable law and agreement. The precise controller, business, processor, or service-provider roles should be read together with the Mela Privacy Policy and any signed Data Processing Agreement.

7.3 Purpose limitation and ownership

- Customers retain their rights in meeting content, prompts, files, participant information, configuration, and other customer-provided data.
- Armely processes customer data only for authorized service, security, support, and related contractual purposes.
- Mela customer meeting content is not sold for cross-context behavioral advertising.
- Customer meeting content is not used to train unrelated general-purpose models unless the customer expressly agrees in writing.
- Customers are responsible for ensuring they have the rights, authority, and required participant notices or consents for the content they instruct Mela to process.

7.4 Data minimization

Organizations should avoid placing passwords, secret keys, authentication codes, or unnecessary highly sensitive personal information into meetings, prompts, support tickets, or other Mela interactions. Where sensitive information must be processed, the customer should confirm that the applicable agreement, configuration, and internal policy support that use case.

7.5 Retention and deletion

For Mela Meeting Assistant, the standard transcript retention period is 30 days from meeting capture. Mela does not retain meeting audio or video as stored customer media. Other data categories, including derived outputs, identity data, operational logs, and recovery copies, are retained only as needed for the service, security, contractual, legal, and recovery purposes described in this guide and the applicable agreements. If a signed customer agreement specifies a different retention commitment, the signed agreement controls.

Data type	Retention approach
Meeting audio / video	Not retained by Mela as stored customer media. Audio is processed in real time through Azure AI Speech to generate transcript text.
Meeting transcripts	Standard retention is 30 days from meeting capture. Any different contractual retention commitment must be documented in the applicable signed agreement.
Derived meeting outputs	Summaries, minutes, decisions, action items, and related outputs are retained according to the applicable product configuration, contract, and customer deletion requirements.
Identity / tenant administration data	Maintained while needed to operate the customer account, enforce authorization, support security, and satisfy contractual or legal obligations.
Operational and security logs	Retained for a limited period appropriate to service operation, security monitoring, investigation, and compliance needs.
Backups / recovery copies	May persist for a limited period under standard backup lifecycle controls after active data is deleted, where technically necessary.
Termination / account closure	Return and deletion follow the applicable agreement and Privacy Policy, subject to legal, security, and backup requirements.

7.6 Privacy requests and customer administration

Requests to access, correct, delete, or otherwise exercise privacy rights should be handled according to the role of each party and the applicable law. For organizational meeting content, customers may need to coordinate requests through their own administrator because the customer determines the business purpose and authorized use of that content.

7.7 International use and data location

Customers operating across jurisdictions should review applicable data transfer, residency, sector, and workplace privacy requirements before deployment. Specific data location or residency commitments should be confirmed in the applicable order form, deployment configuration, or signed agreement rather than assumed from this guide.

8. Security Architecture & Control Framework

8.1 Security principles

- Least privilege: access is limited to what is needed for an approved role or service function.
- Tenant separation: protected customer content is logically scoped to the authorized organization and user context.
- Defense in depth: identity, authorization, encryption, logging, monitoring, secure configuration, and operational processes work together.
- Secure by default: protected content requires appropriate identity and tenant authorization rather than relying on obscurity.
- Human review for consequential output: users review generated tasks and meeting intelligence before relying on or publishing them.
- Shared responsibility: service-side controls are paired with customer Microsoft 365, endpoint, policy, and user-management controls.

8.2 Identity and access management

Control	Description
Enterprise identity	Protected organizational access is tied to the customer's Microsoft identity and tenant context.
Administrator authorization	Microsoft 365 administrators approve required application permissions and deployment scope.
Role-based access	Access to administration and protected information is limited by role and tenant.
Tenant authorization	Tenant activation / allowlisting and service-side authorization checks restrict service access to authorized organizations.
Least privilege	Permissions and privileged access are limited to the minimum necessary for approved functions.
Access lifecycle	Administrative and workforce access is provisioned, reviewed, and removed according to role and business need.

8.3 Encryption, key management & secrets

- Customer data is protected in transit using encrypted network connections.
- Transcripts, summaries, and other protected stored content are encrypted at rest using the controls of the underlying enterprise Azure services.
- Mela uses Azure Key Vault to centrally protect and manage application keys, secrets, connection values, and other sensitive configuration data. Sensitive values are not embedded directly in application source code.
- Where application components require environment variables, protected values are supplied to the application environment from approved secret-management mechanisms rather than committed to source control or maintained in plaintext production .env files. Access to secrets is restricted to authorized application components and administrative roles.
- Customers should not send passwords, secret keys, tokens, or other credentials to Armely support.

8.4 Tenant isolation and authorization

Mela is a multi-tenant service with logical customer separation. Requests for protected meeting content are evaluated using the requesting user, tenant, role, and applicable authorization context. Tenant-aware filters and authorization checks enforce organization boundaries so one customer cannot retrieve another customer's protected data through normal application paths.

Important distinction

Tenant isolation does not remove the need for customer governance. Customers must still manage their own Microsoft 365 identities, group membership, role assignments, account termination, sharing controls, and endpoint security.

8.5 Logging, monitoring, and alerting

- Operational events are logged to support health monitoring, diagnostics, incident investigation, and service reliability.
- Security-relevant events are monitored for suspicious behavior, service degradation, access issues, and conditions requiring investigation.
- Alerting and escalation processes distinguish routine operational events from incidents that require investigation, containment, escalation, or customer communication.
- Logging is configured to avoid unnecessary sensitive content, and access to operational and security logs is restricted to authorized personnel and service components.

8.6 Vulnerability and patch management

- Security updates and dependency fixes are evaluated and applied based on risk, severity, exploitability, exposure, and operational impact.
- Application and infrastructure changes are reviewed, tested, and deployed through controlled change processes.
- Security findings are prioritized and tracked based on severity, exploitability, exposure, and business impact.
- Customers or researchers who believe they have found a vulnerability should report it privately rather than disclose it publicly.

8.7 Secure development and change management

Changes to Mela follow an authorized development lifecycle that includes source control, responsible review, testing, controlled deployment, and rollback or remediation planning appropriate to the change. Production access and changes are limited to authorized personnel and are logged or otherwise auditable where applicable.

8.8 Workforce and administrative safeguards

Personnel with access to non-public customer information are subject to confidentiality and security obligations. Access is granted according to job need and removed when no longer required. Privileged access receives additional restriction and review.

8.9 Third-party and subprocessor risk

Mela depends on Microsoft 365 and Azure services, including Azure AI Speech for transcription and Azure OpenAI Service for authorized transcript processing. Armely also uses service providers for supporting functions such as hosting, communications, security, analytics, and support. Third-party access is limited to the service need and remains subject to applicable contractual, confidentiality, and security requirements. Customers that require a current subprocessor list should request it from Armely or refer to the applicable agreement.

8.10 Incident response

Stage	Control objective
Detect	Identify security or availability events through monitoring, alerts, support reports, or other signals.
Communicate	Notify affected customers or authorities when required by applicable agreement or law.
Triage	Determine severity, scope, affected systems / tenants, and immediate containment needs.
Contain	Limit unauthorized access, service impact, or continued exposure.
Investigate	Preserve relevant evidence and determine root cause, impact, and required remediation.
Recover	Restore safe operation, validate controls, and monitor for recurrence.
Improve	Document lessons learned and implement corrective / preventive actions.

Armely maintains an incident response process for security and availability events affecting Mela. The process covers detection, triage, containment, investigation, recovery, required communication, and post-incident improvement. Customer notifications are handled in accordance with applicable contractual and legal requirements.

8.11 Business continuity and recovery

Service resilience includes maintaining documented recovery procedures appropriate to the service, protecting required recovery data, testing restoration or recovery capabilities where appropriate, and considering Microsoft 365 or upstream service dependencies. Contractual recovery time or service-level commitments apply only where expressly stated in a signed agreement.

9. AI Governance & Responsible Use

9.1 AI-generated output

Mela uses Azure OpenAI Service to process authorized transcript content and generate summaries, decisions, tasks, due dates, risks, and other meeting intelligence. These outputs are assistive, not authoritative. Important decisions should be validated against the source conversation, transcript, and relevant business records.

9.2 Human oversight

- Review task titles, owners, due dates, and decisions before publishing them into Planner or another business system.
- Do not treat a generated summary as a legal transcript or official record unless the customer has independently established that use.
- Escalate ambiguity rather than infer intent when the meeting discussion is unclear.
- Apply extra review to employment, compliance, customer commitment, safety, legal, or financial decisions.

9.3 Model and training boundaries

Customer meeting content is not used to train unrelated general-purpose models unless the customer expressly agrees in writing. Processing may still be necessary to provide requested Mela functionality, secure the service, support users, or improve service quality as permitted by the applicable agreement and privacy policy.

9.4 Responsible deployment practices

- Define the approved meeting types, users, and business purposes for Mela before broad rollout.
- Train users on participant notice, pausing for sensitive discussion, output review, and prohibited content.
- Use data-classification and retention rules that match the sensitivity of the meetings being captured.
- Review connected integrations and permissions whenever the organization enables a new downstream workflow.

9.5 Higher-risk use cases

Use additional review and contractual confirmation before using Mela for meetings that routinely contain regulated, highly sensitive, or legally privileged information. Examples may include protected health information, payment-card data, authentication secrets, highly sensitive employment matters, or other data subject to sector-specific handling requirements.

9.6 Human review matrix

Output	Recommended review before use
Meeting summary	Confirm material facts, decisions, and omitted context.
Action items	Confirm owner, wording, due date, and whether the commitment was actually made.
Executive recap	Confirm risks, decisions, and next steps before executive distribution.
Planner task	Review before publishing to the shared plan.
Draft email	Review recipients, tone, facts, commitments, and confidential content before sending.

10. SOC 2 Security and Compliance Program

Armely is actively progressing through its SOC 2 readiness and attestation program and has begun the formal process toward independent SOC 2 examination. The program is part of Armely's ongoing commitment to strengthening the security, availability, confidentiality, and operational governance of Mela.

Current SOC 2 program status

Armely has begun the formal SOC 2 process and is preparing its controls and supporting evidence for independent assessment. Until the independent examination is completed and the applicable SOC 2 report is issued, Armely does not represent Mela as SOC 2 attested.

10.1 Program scope and Trust Services Criteria

The program is being developed around the applicable AICPA Trust Services Criteria and includes the formalization, operation, documentation, and validation of security and operational controls across the Mela environment. The current program covers identity, authorization, change management, monitoring, vulnerability management, incident response, encryption and secrets, retention, tenant isolation, vendor governance, business continuity, and supporting policies and evidence.

Control area	Program focus
Identity and access management	Enterprise identity, authentication, authorization, role-based access, tenant scoping, and access lifecycle controls.
Privileged access and authorization	Restricted administrative access, least privilege, and additional oversight for privileged functions.
Change and release management	Source control, review, testing, controlled deployment, and rollback or remediation planning.
Security monitoring and logging	Operational and security event logging, monitoring, alerting, escalation, and investigation support.
Vulnerability and patch management	Risk-based evaluation, remediation, dependency updates, and security patching.
Incident response and escalation	Detection, triage, containment, investigation, recovery, communication, and lessons learned.
Encryption and secret management	Encryption in transit and at rest for protected content, with Azure Key Vault used for application secrets and sensitive configuration.
Data retention and disposal	30-day transcript retention, non-retention of meeting audio/video, controlled deletion, and backup lifecycle handling.
Tenant isolation and data access	Tenant-aware authorization and logical separation of protected customer content.
Vendor and service-provider governance	Review and governance of material service providers and dependencies.
Business continuity and availability	Recovery procedures, resilience planning, service monitoring, and dependency awareness.
Security policies and evidence	Documented policies, procedures, ownership, control operation, and supporting evidence for independent assessment.

10.2 Current program status

Armely has begun the formal SOC 2 process and is actively preparing controls and supporting evidence for independent assessment.

Program item	Current status
SOC 2 readiness and attestation program	Active and progressing; formal process toward independent examination has begun.
Independent SOC 2 examination	Not yet completed as of this edition.
SOC 2 report / attestation	Not yet issued. Mela is not represented as SOC 2 attested until the applicable independent report is issued.

10.3 Independent assessment and evidence

The independent SOC 2 examination has not yet been completed and an applicable SOC 2 report has not yet been issued. Accordingly, Armely does not represent Mela as SOC 2 compliant, SOC 2 certified, or SOC 2 attested. Customers conducting enterprise security reviews may request current program information and available supporting assurance documentation, subject to confidentiality and availability restrictions.

10.4 Customer assurance and program updates

- Until the independent examination has been completed and the applicable SOC 2 report has been issued, Armely does not represent Mela as SOC 2 attested.
- As the SOC 2 program progresses, applicable customer-facing security and compliance documentation will be updated to reflect the current attestation status.
- Customers conducting security or procurement reviews may request Armely's current SOC 2 program status and available assurance documentation, subject to appropriate confidentiality and availability restrictions.

11. Customer Deployment Security Checklist

Before rollout	Customer check
Identity	Confirm Entra ID tenant, administrator roles, MFA / Conditional Access, and approved user group.
Permissions	Review requested Mela permissions and document administrator approval.
Meeting policy	Define who may invoke Mela and in which meeting types it may be used.
Privacy	Document participant notice / consent approach for relevant jurisdictions and workforce policies.
Data classification	Define what content is permitted, restricted, or prohibited in Mela-assisted meetings.
Retention	Define required meeting transcript / summary retention and deletion expectations.
Output review	Tell users to review AI-generated tasks, commitments, due dates, and summaries.
Endpoint security	Ensure users access Mela from appropriately managed devices where required.
Support	Provide administrators and users with support and security reporting contacts.
Periodic review	Reassess permissions, users, integrations, retention, and security requirements after material changes.

12. Frequently Asked Questions

Do I need to sign in to use Mela?

Basic help or supported invocation behavior may not require a separate Mela sign-in. Access to protected organizational transcripts, summaries, administration, and other customer data requires an authorized organization and the applicable identity / tenant checks.

How do I start and stop meeting capture?

Use the supported Teams chat command to ask Mela to join. Use the pause / unpause commands for sensitive moments and the leave command to stop meeting capture and remove Mela from the meeting.

Does Mela notify participants that it is present?

Mela is designed to provide notice in the Teams meeting experience when it joins. Customers must still determine and satisfy any additional legal or policy notice and consent requirements.

Does Mela retain video or audio recordings?

No. Mela does not retain meeting audio or video as stored customer media. Meeting audio is processed in real time through Azure AI Speech only as needed to generate transcript text.

Does Mela notify process and store meeting content?

Azure AI Speech converts authorized meeting speech into transcript text. Azure OpenAI Service processes authorized transcript content to generate requested meeting intelligence. Protected stored content uses encrypted service storage and is logically scoped to the authorized organization. Specific hosting or residency commitments should be confirmed in the applicable agreement or deployment documentation.

Who owns meeting data?

Customers retain their rights in customer meeting content and other customer-provided data. Armely receives only the rights needed to provide, secure, support, and operate the service under the applicable agreement.

Does Armely sell Mela meeting content?

Mela meeting content is not sold for cross-context behavioral advertising.

Is meeting content used to train AI models?

Customer meeting content is not used to train unrelated general-purpose models unless the customer expressly agrees in writing.

How long are meeting transcripts retained?

The standard Mela transcript retention period is 30 days from meeting capture. Meeting audio and video are not retained by Mela. Other data categories follow the retention approach described in Section 7.5 and the applicable customer agreement.

Can customer data be deleted?

Deletion and return are handled according to the applicable agreement, Privacy Policy, tenant configuration, and legal / backup requirements. Customers with specific deletion timelines should document them contractually.

Can Mela send email or create Planner tasks automatically?

Mela supports these workflows, but protected Microsoft 365 actions depend on authorization and supported product behavior. Users should review generated content before consequential actions are completed.

How does tenant isolation work?

Mela is designed to scope protected content by organization and authorized user context. Customers also remain responsible for Microsoft 365 role, group, identity, and sharing governance.

What is Armely's current SOC 2 status for Mela?

Armely is actively progressing through its SOC 2 readiness and attestation program and has begun the formal process toward independent examination. The examination has not yet been completed, and a SOC 2 report has not yet been issued, so Armely does not represent Mela as SOC 2 attested at this stage.

How do I report a security issue?

Send a private report to support@armely.com with the subject SECURITY. Do not post suspected vulnerabilities publicly.

How do I get Mela for my organization?

A Microsoft 365 administrator completes onboarding, approves required permissions, configures access policies, and completes tenant activation before protected organizational use.

13. Support, Security & Privacy Contacts

Need	Contact / route
Product help and technical support	support@armely.com
Security vulnerability reporting	support@armely.com - use subject: SECURITY
Terms, privacy, or general Mela questions	ask.me@armely.com
General Armely inquiries	info@armely.com
Phone	+1 972 460 0643
Mailing address	Armely, LLC, 17400 Dallas Pkwy, Suite 111, Dallas, TX 75287, United States

13.1 When contacting support

- Describe what happened and what you expected to happen.
- Include the approximate date, time, time zone, organization / tenant name, and user account involved.
- Include screenshots or exact error messages when useful.
- Do not include passwords, secret keys, one-time codes, or other credentials.
- For suspected security issues, mark the message clearly as SECURITY and avoid public disclosure while the issue is being investigated.

Contract hierarchy

If this guide conflicts with a signed order form, Data Processing Agreement, Master Services Agreement, subscription agreement, or other signed customer agreement, the signed agreement controls. Current online Terms of Use and Privacy Policy also apply according to their own terms.

Appendix A - Security Review Summary

Question	Customer-facing response
Uses Microsoft enterprise identity?	Yes. Protected organizational access uses Microsoft Entra ID and tenant-aware authorization.
Admin consent required?	Yes, for required Microsoft 365 application permissions.
Role-based access?	Yes. Protected data and administrative functions are role- and tenant-scoped.
Encrypted in transit?	Yes.
Encrypted at rest?	Yes, for protected stored meeting content using enterprise Azure service controls.
Tenant separation?	Yes. Tenant-aware authorization and logical organization-level scoping are enforced.
User-controlled meeting capture?	Yes, through join, pause, resume, and leave controls.
Meeting audio / video retained?	No. Mela does not retain meeting audio or video as stored customer media.
Standard transcript retention?	30 days from meeting capture.
How is speech transcribed?	Azure AI Speech processes authorized meeting audio in real time to generate transcript text.
How is meeting intelligence generated?	Azure OpenAI Service processes authorized transcript content to generate requested summaries, decisions, action items, risks, due dates, and related outputs.
How are application secrets protected?	Azure Key Vault centrally protects application keys, secrets, connection values, and sensitive configuration.
Customer data used to train unrelated general-purpose models?	No, unless the customer expressly agrees in writing.
Security monitoring and incident response?	Yes. Operational and security events are logged and monitored, and Armely maintains an incident response process.
Current SOC 2 status?	Armely is actively progressing through its SOC 2 readiness and attestation program. Independent examination is not yet complete and no applicable SOC 2 report has been issued.

Appendix B - Quick Command Card

Need	Example command
Start meeting capture	@mela please join
Pause for a sensitive discussion	@mela pause recording
Resume	@mela unpause recording
Stop / leave	@mela please leave
Catch up	@mela what did last person say
Ask about a participant / topic	@mela what did [name] say about [topic]

Need	Example command
Create a recap	summarize
Create formal minutes	generate minutes
Retrieve transcript	fetch transcript
Create private one-page recap	send me the executive summary
Email the latest recap	send the last summary to my email
Review inbox	check my inbox
Calendar	what meetings do I have today
Help	@mela help

Appendix C - Revision History

Date	Edition	Summary
September 14, 2026	Consolidated edition	Expanded the original user guide into an enterprise-ready product, privacy, security, AI governance, deployment, FAQ, support, and compliance guide.
September 14, 2026	Security baseline update	Confirmed Azure AI Speech and Azure OpenAI Service processing, no meeting audio/video retention, 30-day transcript retention, Azure Key Vault secret management, present-tense operational controls, and the active SOC 2 readiness and attestation program status.
